

Eliminator - *There is no substitute!*

The new Lion Nathan Breweries flagship plant at Auckland has a high specification build with an overall project cost of NZ\$250 million.

"The new operation will provide a number of productivity, customer responsiveness, environmental and employee advantages, including an expected NZ\$12-15 million annual reduction in operating costs," Lion Nathan Corporate Affairs Director Liz Read said.

With 55,000m² of 200mm deep, post tension slab to construct, more than 1,000 linear metres of prefabricated steel joint was needed, and the expected joint openings were calculated to be between 40 and 90mm wide. The construction company MainZeal, the contractor Grouting Services, and the engineers Beca, all had to be satisfied that the joint selected could meet all of their requirements.

Metalscreed's Eliminator joint was put forward as the most suitable for the task, easily meeting the clients quality and performance criteria, and coming in on budget. The joints were assembled and supplied by Canzac Limited, Metalscreed's agent and distributor in New Zealand, and Canzac's experienced technical staff attended to oversee the installation of the joints and slabs.

The result was a first class installation, with the floor looking good and meeting all of the required specifications, safe in the knowledge that the Eliminator Joints would cope with the wide gaps and function correctly, proving once again that it really does pay to use the best!
